                                                                                                                                                                                                                                                                                                                                  Biol. Chem. 275:10767-10771(2000).

FUNCTION: Receptor for UDP-glucose and other UDP-sugar coupled G-proteins. Not activated by ATP, ADP, UTP or ATP.

SUBCELLULAR LOCATION: Integral membrane protein.

TISSUE SPECIFICITY: Highest expression in the placenta, adipose tissue, stomach and intestine, intermediate levels in the brain spleen, lung and heart, lowest levels in the kidney.

SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     301

In human and mouse cDNA sequences.";

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).

Ci. FUNCTION: Orphan receptor. Seems to be a G(i)-coupled receptor displaying a high affinity for ADP. Might play a role in hematopoiesis and the immune system.

Ci. Hematopoiesis and the immune system.

Ci. INTESUE SPECIFICITY: Strong expression in spleen and adult brain.

Ci. Lower expression in placenta, lung, liver, spinal cord, thymus, and adrenal muscle small intestine, uterus, stemach, testis, fetal brain, and adrenal gland. Not detected in pancreas, heart, kidney, skeletal muscle, ovary or fetal aorta. Clearly detected in lymph node and bone marrow, weakly detected in peripheral blood mononuclear cells (PBMC) and in peripheral blood leukocytes (PBL), but not detected in polymorphonuclear cells (PMN). In the brain, detected in all
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    EMBL; AP295368; AAK01864.1; --

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   brain regions examined.

MISCELLANBOUS: Stimulation by ADP in stably transfected CHO cells resulted in inhibition of adenylyl cyclase and the phosphorylatic of the MAP kinases MAPK3 and MAPK1 in a pertusis toxin-sensitive way. Inhibition of adenylyl cyclase and phosphorylation of the MAP kinases are transduction mechanisms that involve G(i) proteins. kinases are transduction mechanisms that involve G(i) proteins. SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       s requires a license agreement (See http://www.isb-sib.ch/announce/an email to license@isb-sib.ch).

Seems to be a G(i)-coupled receptor displaying a high affinity for Might play a role in hematopolesis and the immune system (By similarity). SUBCELLULAR LOCATION: Integral membrane protein. SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                    137

J. Biol. Chem. 276:47489-47495 (2001).
J. FUNCTION: Receptor for cysteinyl leukotrienes. The response is mediated via a G-protein that activates a phosphatidylinositol-calcium second messenger system. The rank order of affinities for the leukotrienes is LTC4 = LTD4 >> LTE4.
                                                                                                                                                                  Hui Y., Yang G., Galczenski H., Figueroa D.J

Seem to mediate its action via a G protein that activate a phosphatidylinositol-calcium second messenger system.

SUBCELLULAR LOCATION: Integral membrane protein.

SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                        S13638;

Score 1874;

DB 3;

Length 358;

Sequence 358 AA;

The present sequence is human HG03 protein, which is a G protein-coupled receptor (GPCR). It shows homology to human platelet activating factor receptor. HG03 is expressed at high levels in prostate, placenta and trachea and at low levels in thymus and testis. HG03 expression vectors can be used to transform host cells, which may be used in screening for agonists or antagonists that are potential pharmaceuticals. It can be used in gene therapy for treatment of diseases associated with low HG03 activity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is G-protein coupled receptor designated 2871. This is expressed in prostate, uterus and placenta and participates in signalling pathway. The receptor polypeptide is useful in drug screening assays, and to identify modulating agents. Epitope bearing peptides are used to raise specific antibodies. The polypeptide and modulating agents can also be used for the modulation, diagnosis or treatment of immune or respiratory disorders, e.g. Crohn's diagnosis or treatment of parasitic infections, cystic fibrosis, pneumonnia, Legionnaires disease or sinusitis
                                                                                                                                                                                                                                             Human;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is a novel human G protein coupled receptor designated HORK2. The total length HORK2 cDNA was obtained by reverse transcription-polymerase chain reaction (RT-PCR) using human spleenderived mRNA as the template. The G protein coupled receptor may be used to screen for agents that are useful in the prevention and treatment of immune diseases and inflammatory diseases such as bronchitis and allergy
  A new G protein coupled receptor and G protein coupled receptor gene

This is useful as a screening tool for preventive and treatment agents of immune inflammatory diseases such as bronchitis and allergies. The present sequence is the protein of

The 2871 receptor is used for screening a compound that acts as agonist and antagonist to 2871 receptor. The compounds can be used for treating disorders such as immune disorders (e.g., asthma and glomerular nephritis), respiratory disorders (e.g., bronchitis and cystic fibrosis), haematopoletic disorders involving cells of leukocyte, erythroyte and platelet lineages, bone marrow disorders (e.g., leukaemias and lymphoma), brain disorders (e.g., intracranial haemorrhage, cute meningitis, multiple sclerosis and Alzheimer's disease), heart disorders (e.g., rheumatic heart disease, angina pectoris and myocardial infarction), blood vessel disorders (e.g., autosomal recessive polycystic kidney disease, acquired cystic disease and Heymann nephritis), prostate disorders (e.g., nodular hyperplasia and carcinoma), skeletal muscle disorders (e.g.,

                                                 The present sequence represents a human octoray polypeptide. Octoray is a member of the G-protein coupled receptor family. Octoray polypeptides, polymucleotides and antibodies are useful for diagnosis and treatment of certain disease, including bacterial, fungal, protozoan and viral infections, particularly infections caused by HIV-1 and HIV-2, pain, cancer, diabetes, obesity, amorexia, bulimia, asthma, Parkinson's disease, acute heart failure, hypotension, hypertension, urinary retention, osteoporosis, angina pectoris, myocardial infarction, stroke, ulcers, allergies, benign prostatic hypertrophy, migraine, vomiting, psychotic and neurological disorders, including anxiety, schizophrenia, manic depression, depression, delirium, dementia, and severe mental retardation, dyskinesia, such as Huntington's disease or Gilles dela

The present invention describes a method for detecting a bladder cancer-
associated transcript in a cell from a patient. The method comprises
contacting a biological sample from the patient with a polynucleotide
that selectively hybridises to a sequence that is 80 % identical to a
table of sequences (see ACC50951 to ACC51059). ACC50951 to ACC51059
encode the human bladder cancer-associated proteins given in ABR48146 to
ABR48242). Bladder cancer-associated sequences from the present invention
have cytostatic activities, and can be used in antisense gene therapy and
                                                                                                                                                     Detecting a bladder cancer-associated transcript in a cell patient, comprises contacting a biological sample from the bladder cancer-associated polynucleotide or antibody.

The method can be used for detecting a bladder cancer-associated transcript in a cell from a patient. The method is useful in diagnosing or treating bladder cancer and in screening for compounds that modulate bladder cancer, such as hormones or antibodies. The nucleic acid molecules from the present invention may be used in various screening and diagnostic methods, and for gene therapy, vaccine and/or antisense/inhibition applications

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polynucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits concreased or decreased expression in lung cancer samples. Lung cancer-associated polynucleotides and polypeptides are used for identifying a compound that modulates a lung cancer-associated polypeptide, for compound that modulates a lung cancer-associated polypeptide, for cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful concer in a patient and for treating a mammal having lung cancer, non-small cell contracting lung cancer, such as small cell lung cancer, non-small cell contracting concer or other benign or precancerous lesions, e.g. atelectasis, complysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and bronchiectasis. The genes, polymucleotides and polypeptides are useful compounds that modulate lung cancer, such as antibodies. Sequences compounds that modulate lung cancer, such as antibodies. Sequences concerning for theresentice.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

The genes and proteins are useful for eliciting a humoral or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   10-APR-2001;

The present invention describes antigenic peptides (I) comprising: (a) any one of 1601 sequences (see ABP82019 to ABP83619) of 12-24 amino CC acids. Also described: (1) an assay for the detection of a particular G protein-coupled receptor (GPCR) or a candidate polypeptide in a sample; CC and (2) an isolated antibody having high specificity and high affinity or CC avidity for a particular GPCR. (I) can be used as GPCR modulators and in CC gene therapy. The antigenic peptides for GPCRs are useful in detecting the presence or absence of corresponding GPCRs. The antigenic peptides for GPCRs are useful for detecting the CC presence or absence of corresponding GPCRs. The antigenic peptides for CPCRs and antibodies are also useful for detecting the reating immune-related diseases, growth-related diseases, cell CC regeneration-related disease, immunological-related cell proliferative diseases, or autoimmune diseases, e.g. AIDS, Alzheimer's disease, cell cc atherosclerosis, bacterial, fungal, protozoan or viral infections, osteoparthritis, osteoparosis, cancer, cardiomyopathy, chronic and acute inflammation, allergies, Crohn's disease, disease, disease, disease, disease, parkinson's disease, multiple sclerosis, pain, psoriasis, cancer, cardiomyopathy, chronic and acute disease, paintery, depression, schizophrenia, descrosis, obesity, nausea, hypertension, comportension, renal disorders, rheumatoid arthritis, trauma, ulcers, or canny other disease and immunodisgonesis. NaEA4523 to ABZ4369 encode CC GPCR proteins given in ABP81675 to ABP82018, which are used in the cc gPCR proteins of the present invention

```
The invention relates to an isolated G-protein coupled receptor nucleic cc acid molecule encoding the G-protein coupled receptors 2871, 14926, 17723 cc and 23992. The nucleic acid molecule is useful in monitoring, diagnosing cd and treating immune disorders (e.g. Crohn's disease and Graw's disease); cc disorders (e.g. leukaemia and systemic sclerosis); haematopoietic cc disorders (e.g. penumonia or diphtheria); haematopoietic cc quite mastitis and paget's disease); muscular disorders (e.g. cc acute mastitis and paget's disease); muscular disorders (e.g. cc rhabdomyosarcoma); neurological disorders (e.g. ccrebral oedema and cc rharosclerosis); diseases involving testis and epiddymis (e.g. atrophy cc atherosclerosis); diseases involving testis and epiddymis (e.g. atrophy cc and syphilis); thyroid diseases (e.g. hyperthyroidiam and cretinism); cc and syphilis); thyroid diseases (e.g. hyperthyroidiam and cretinism); cc diseases (e.g. pancreatitis and diabetes mellitus); diseases involving cc diseases (e.g. pancreatitis and diabetes mellitus); diseases involving cc diseases (e.g. pancreatitis and diabetes mellitus); diseases involving cc diseases (e.g. pancreatitis and diabetes mellitus); diseases involving the spleen (e.g. splenomegaly and Gaucher disease); diseases (e.g. involving the liver (e.g. hepatic failure and alcoholic liver disease); cell disorders (e.g. systemic lupus erythematosus and AIDS); B-cell coll disorder (e.g. systemic lupus erythematosus and AIDS); B-cell (e.g. thrombocytopenia and haemolytic-uraemic syndrome). The nucleic (e.g. thrombocytopenia and haemolytic-uraemic syndrome). The nucleic coll present sequence represents the amino acid sequence of the human G-creation councied receptor 2871

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Homo sapiens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to novel Mowgli G-protein coupled receptor (GPCR) polypeptides and polynucleotides. Mowgli polypeptides, nucleic acids, probes, antibodies, expression vectors and ligands are useful as the probes, antibodies, expression vectors and ligands are useful as with over-, under- or abnormal expression of Mowgli GPCR in tissues, in with over-, under- or abnormal expression of Mowgli GPCR in tissues, in with over-, under- or abnormal expression of Mowgli GPCR in tissues, in with over-, under- or abnormal expression of Howgli Polypeptides of the genetic analysis and in chromosome identification. Polypeptides of the invention may be used for screening compounds which bind the receptor and invention and year of the produce antibody and/or T cell immune response against e.g. bacterial, produce antibody and/or T cell immune response against e.g. bacterial, protozoan, fungal or viral infections, pain, cancers, diabetes, obesity, protozoan, sethma, Parkinson's disease and other neurological disorders. anorexia, asthma, Parkinson's disease and other neurological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           16-MAY-2002; 2002WO-GB002304
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WO200292624-A2

                                                                                                                                                                                 The invention relates to novel Mowgli G-protein coupled receptor (GPCR) polypeptides and polynucleotides. Mowgli polypeptides, nucleic acids, probes, antibodies, expression vectors and ligands are useful as biosensors, for detection, diagnosis, or treatment of diseases associated with over-, under- or abnormal expression of Mowgli GPCR in tissues, in genetic analysis and in chromosome identification. Polypeptides of the invention may be used for screening compounds which bind the receptor and which activate (agonists) or inhibit (antagonist) activation of Mowgli. They may further be used as vaccines to induce immunological response to produce antibody and/or T cell immune pain, cancers, diabetes, obseity, anorexia, asthma, Parkinson's disease and other neurological disorders. The present sequence is human Mowgli G-protein coupled receptor with FLAG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New Mowgli G-protein coupled receptor polypeptides and polynucleotides, useful for inducing immunological response to produce antibody and/or T cell immune response against e.g. bacterial, fungal, protozoan or viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Key

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC The invention relates to novel Mowgli G-protein coupled receptor (GPCR)
CC polypeptides and polynucleotides. Mowgli polypeptides, nucleic acids,
CC probes, antibodies, expression vectors and ligands are useful as
CC probes, antibodies, expression vectors and ligands are useful as
CC biosensors for detection, diagnosis, or treatment of diseases associated
CC with over-, under- or abnormal expression of Mowgli GPCR in tissues, in
CC genetic analysis and in chromosome identification. Polypeptides of the
CC invention may be used for screening compounds which bind the receptor and
CC which activate (agonists) or inhibit (antagonist) activation of Mowgli,
CC which activate (agonists) or inhibit (antagonist) activation of Mowgli,
CC protozoan, fungal or vised as vaccines to induce immunological response to
CC protozoan, fungal or viral infections, pain, cancers diabetes, obesity,
CC protozoan, sethma, Parkinson's disease and other neurological disorders.
CC and vice tar

                                                                                                                                                                                                                                                                                                                                    The invention relates to a gene C-PLACE1003238 encoding a guanosine triphosphate binding protein coupled receptor. The protein can be expressed by standard recombinant methodology. The protein is useful in the diagnosts, prediction and treatment of disease associated with the diagnosts, prediction and protein, and may be useful in brain disease disorders of C-PLACE1003238 protein, and may be useful in Alaheimer's and cancers, as the expression pattern was different in Alaheimer's disease, cancers, and normal tissue. The new materials are useful for disease, cancers, and normal tissue. The present sequence developing diagnostics and treatment agents. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New gene encoding guanosine triphosphate binding protein coupled receptor, and the protein and antibodies to it, for diagnosing ar treating disease such as brain disease.
